

PROJECT REPORT

Importing Data Using Transform Maps and Spreadsheets in ServiceNow

ServiceNow Import Sets and Transform Maps

Final Submission Report

1. INTRODUCTION

1.1 Project Overview

This micro project demonstrates the process of importing structured data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The project simulates a practical enterprise scenario in which bulk employee data is received in Excel format and needs to be migrated into ServiceNow in an efficient and controlled manner.

1.2 Purpose

The purpose of the project is to demonstrate a structured spreadsheet-to-ServiceNow data migration workflow. It focuses on receiving employee records in spreadsheet form, loading the data through an Import Set, applying field mappings and transformation rules through a Transform Map, and transferring the processed records into the appropriate ServiceNow destination. The project also provides a documented set of project artifacts and execution screenshots as evidence of the implemented workflow.

2. IDEATION PHASE

2.1 Problem Statement

Organizations frequently receive employee or operational data in spreadsheet format. Manually entering such records into ServiceNow is repetitive, time-consuming, and susceptible to data-entry inconsistencies. A controlled import mechanism is therefore required to move structured spreadsheet data into ServiceNow while preserving the relationship between source fields and destination fields.

2.2 Empathy Map Canvas

The project artifacts include an Empathy Map Canvas focused on the user need behind spreadsheet-based data migration. The central user concern is to move bulk employee information into ServiceNow with less repetitive manual entry, clear mapping between source and target fields, and a process that can be reviewed and repeated when new spreadsheet data is received.

2.3 Brainstorming

The project repository includes a Brainstorm & Idea Prioritization artifact. The selected direction is the use of ServiceNow Import Sets and Transform Maps to establish a repeatable import workflow rather than relying on manual record creation. This approach directly addresses the identified need for structured bulk data migration.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

The project workflow can be represented as: prepare employee spreadsheet → load spreadsheet into ServiceNow Import Set → review imported source records → configure/use Transform Map → map source fields to ServiceNow target fields → execute transformation → verify resulting records. The journey is centered on reducing manual data entry and making the migration process traceable.

3.2 Solution Requirement

Functional requirements include: accepting structured spreadsheet data; creating an import source/table for staging; defining source-to-target field mappings; applying a Transform Map; executing the transformation; and verifying the resulting ServiceNow records. The solution should also provide sufficient visibility to identify whether the imported data has been processed correctly.

3.3 Data Flow Diagram

External Spreadsheet (Employee Data) → ServiceNow Import Set / Staging Data → Transform Map → Target ServiceNow Records → Verification / Review. The spreadsheet is the source, the Import Set acts as the staging layer, the Transform Map controls the transformation and field mapping, and the target table stores the processed

records.

3.4 Technology Stack

Primary platform: ServiceNow. Data source: Excel/spreadsheet. Core ServiceNow mechanisms: Import Sets and Transform Maps. Documentation and project artifacts: PDF documents, spreadsheet sample, README, and execution screenshots stored in GitHub.

4. PROJECT DESIGN

4.1 Problem Solution Fit

The proposed workflow directly matches the identified problem: spreadsheet-based employee data must be moved into ServiceNow without creating each record manually. Import Sets provide a controlled staging mechanism, while Transform Maps provide the mapping and transformation layer between imported source data and the target ServiceNow records.

4.2 Proposed Solution

The solution uses a spreadsheet as the external source and ServiceNow as the destination platform. The spreadsheet is loaded into an Import Set, where the source data can be reviewed before transformation. A Transform Map defines how the source fields correspond to the target fields. After the transform is executed, the resulting records can be checked in the destination table.

4.3 Solution Architecture

Source Layer: employee spreadsheet. Staging Layer: ServiceNow Import Set. Transformation Layer: Transform Map and associated field mappings. Destination Layer: ServiceNow target records. Validation Layer: review of imported/transformed records using the ServiceNow interface. The repository also contains a dedicated Solution Architecture artifact documenting the intended architecture.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The project can be organized into the following implementation stages: (1) understand the spreadsheet data structure, (2) prepare the ServiceNow import mechanism, (3) load the source data into the Import Set, (4) configure the Transform Map and field mappings, (5) execute the transformation, (6) verify the destination records, and (7) document the implementation using screenshots and supporting artifacts. The repository does not specify calendar dates, so no unsupported dates are included in this report.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Functional verification focuses on whether the spreadsheet data can be loaded into the ServiceNow import workflow and transformed into the intended destination records through the configured mapping. Verification should include checking the imported source records, confirming source-to-target field correspondence, executing the transform, and reviewing the resulting records. The repository contains nine execution screenshots in the screenshots folder that serve as project evidence. Exact performance timings or numerical benchmark results are not stated in the repository materials reviewed, so no unsupported metrics are reported.

7. RESULTS

7.1 Output Screenshots

The repository contains the following execution screenshots: Screenshot (408).png through Screenshot (416).png. These are retained as the visual evidence for the implemented ServiceNow workflow. They should be kept in the repository under the screenshots folder and referenced in the final submission.

8. ADVANTAGES & DISADVANTAGES

Advantages: supports bulk spreadsheet-based data migration; reduces repetitive manual record entry; provides a defined source-to-target mapping process; separates staging from transformation; creates a repeatable workflow for similar imports; and provides a clear verification stage.

Disadvantages: the workflow depends on the source spreadsheet having a suitable structure; incorrect or incomplete source data can affect the imported records; field mappings must be configured correctly; and changes in the source or target schema may require the import configuration to be updated.

9. CONCLUSION

The project demonstrates a practical ServiceNow data-import workflow using Import Sets and Transform Maps. By using a spreadsheet as the external source, staging the data through an Import Set, and applying controlled source-to-target mappings through a Transform Map, the project provides a structured approach to bulk employee-data migration. The supporting project artifacts and execution screenshots document the solution from problem identification through implementation and output verification.

10. FUTURE SCOPE

The solution can be extended to support additional spreadsheet formats and larger datasets, scheduled or recurring imports, stronger validation of incoming records, duplicate detection, data-quality checks, error reporting, reusable mapping configurations, and integration with other enterprise data sources. Further enhancement can also include automated monitoring and notification when an import or transformation produces errors.

11. APPENDIX

Source Code / Project Artifacts

The project is maintained in the GitHub repository. The repository contains the project README, problem statement, empathy map, brainstorming artifact, proposed solution, solution architecture, sample spreadsheet, final report, and screenshots.

Dataset / Sample Data

Sample spreadsheet: Sample spreadsheet.xlsx in the project repository. The project uses structured employee data as the demonstration input.
