PROJECT DESIGN PHASE

Proposed Solution Template

Design Thinking & Architecture
ServiceNow ETL & Integration Track

PROJECT OVERVIEW & SCENARIO DESCRIPTION

This micro project focuses on importing structured data from an external spreadsheet into the ServiceNow platform using **Import Sets** and **Transform Maps**. The project simulates a real-world scenario where bulk employee data is received in Excel format and must be migrated into ServiceNow efficiently and accurately. The spreadsheet data is first loaded into an Import Set table, which serves as a staging area, and a Transform Map is then configured to map source fields to the appropriate target table fields (sys_user). Upon executing the transformation, records are created in the target table and validated to ensure data integrity.

Project team shall fill the following information in the proposed solution template:

Evaluation Rubric: 6 Parameters

S.No.	Parameter	Description & Implementation Details
1.	Problem Statement PROBLEM TO BE SOLVED	Manual data entry of bulk employee rosters into ServiceNow is exceptionally slow, labor-intensive, and susceptible to severe transcription errors. Furthermore, performing direct database imports without quarantine staging leads to duplicate profiles, corrupted schemas, failed reference lookups, and unstandardized data formats. A safe, automated ETL mechanism is required to ingest external spreadsheets with zero data loss.
2.	Idea / Solution Description ARCHITECTURAL WORKFLOW	An end-to-end automated ETL migration pipeline utilizing native ServiceNow Import Sets and Transform Maps : • Staging Buffer: External Excel data is uploaded via a Data Source into an isolated Import Set staging table (u_imp_employee_data), preventing direct writes to production. • Field Transformation: Configured Transform Map maps source columns to the live sys_user schema using Auto Map and custom field maps. • Deduplication via Coalesce: Sets unique identifiers (User ID / Email) with Coalesce = true to update existing records and insert only new profiles. • Validation: Post-transform auditing via Transform History logs to verify row-by-row data parity.
3.	Novelty / Uniqueness KEY DIFFERENTIATOR	• Isolated Staging Boundary: Unlike risk-prone background scripts, the staging layer quarantines uncleaned data, allowing pre-transformation dry runs and instant rollbacks. • Codeless Deduplication Engine: Native coalesce logic prevents duplicate record generation without requiring custom database triggers or complex API code. • Extensible Transformation Hooks: Built-in onBefore / onAfter event scripting allows dynamic date standardizing and reference field resolution during execution.
4.	Social Impact / Customer Satisfaction USER & ORG IMPACT	• Day-One Onboarding Parity: Eliminates onboarding backlogs, guaranteeing newly hired personnel gain verified ServiceNow credentials and role access immediately on hire date. • Eliminates Admin Fatigue: Replaces days of monotonous manual typing with a 2-minute automated run, drastically reducing human error and workplace stress. • High Data Trust & Governance: Stakeholders gain audit confidence through automated logging and consistent field standards across enterprise departments.
5.	Business Model REVENUE & COST ROI	• Zero Added Licensing Costs: Leverages built-in ServiceNow System Import Set capabilities without requiring expensive external iPaaS middleware (MuleSoft / Boomi). • Substantial Labor Cost Savings: Cuts administrative workload by over 90% (reducing ~40 hours of manual record creation to under 3 minutes per intake). • Direct Risk Mitigation ROI: Protects license allocations and eliminates business downtime caused by broken user profiles and schema corruption.
6.	Scalability of the Solution
